

Problem Statement

Unfortunately I don't still have the original document for this project but we had to come up with a design for an Android app that used a sensor and solved some problem for a potential stakeholder. While doing so we were expected to stick to the Agile methodology as closely as possible and we were responsible for finding appropriate stakeholders as well.

We decided on a heart sensor which allowed us to build an app for athletes who've suffered from a concussion and would allow them to return to play faster by managing their heart rate during their workouts while still in their recovery phase.
